Dayframe

AI-powered 24-hour planner (Smart Planner Pro)

Author: Aaryan Bhargava
Live URL: smartplanner-pro.vercel.app
Date: October 2026

STATUS: VERCEL PRODUCTION LIVE

Product thesis

Dayframe aims to remove the **Setup Tax** of organising your day. Instead of building databases in Notion or hand-filling calendar slots, the user dumps messy input (typed text, a voice note, a screenshot or receipt) and the app sorts it into tasks, time blocks and expenses, then shows the day on a **24-hour circular dial**.

Central teardown question

Does Dayframe save net time end-to-end, or does it just move the work from manual entry to reviewing and fixing AI mistakes?
The reference draft estimates planning drops from **~22 min (manual setup) to under 90 s** if extraction accuracy stays above ~90%. That is a hypothesis to validate with real user testing, not merely an assumed result.

Verdict at a glance

Area	Verdict	Why
Core idea	Strong	One capture box feeding tasks, schedule and money is a clear wedge; the 24h dial is a real differentiator for time-blind users.
Capture UX	Strong	Text, voice, audio file, image upload and Ctrl+V screenshot paste, all in one place. Guest mode means zero signup wall.
Trust and privacy	Needs work	Sign-in asks only name and email (no password step visible) while the page claims 100% private and encrypted. Claims should match mechanism via OAuth/OTP.
Money layer	Distinctive	Bank SMS / UPI auto-log via webhook is powerful for India, but setup (MacroDroid + local IP / ngrok) is power-user only.
Retention loop	Gap	Day view is static: no ripple reschedule when meetings overrun, and 7-day journal auto-purge works against habit building unless Drive is connected.
Monetisation	Plausible	Freemium at $8 / Rs 499 per month fits; AI cost caps on the free tier are the key commercial lever.

Live Evidence Note: All visual screens in this document are **authentic high-resolution screenshots** captured directly from the live Vercel production deployment at `smartplanner-pro.vercel.app`.

1. Product overview and strategic framing

Element	Analysis
Product	Dayframe (Smart Planner Pro): installable PWA (Apple web-app meta present), dark theme, INR / USD / EUR / GBP / AED currency switch.
Category	AI daily planning, multimodal capture and circadian time blocking.
Primary user	Busy working professionals juggling meetings, expenses and personal tasks; Gen-Z students and ADHD / visual planners.
Core problem	Tasks, money and schedule are scattered across WhatsApp, calendar, Splitwise and notes. Manual entry is tiring.
Value prop	'Dump and Done': capture in seconds, AI sorts into tasks, schedule and expenses, app plots the day.
Business model	Freemium: free local-first capture and dial; Pro adds cloud sync, unlimited AI and calendar integration.

2. Personas and jobs-to-be-done

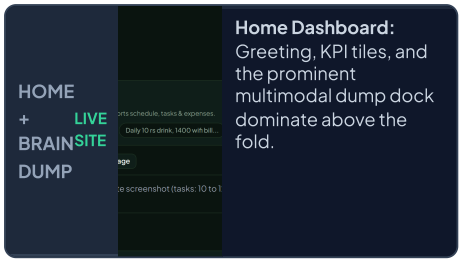

Persona	Share	Context	JTBD
Time-poor professional (primary)	40%	6+ meetings a day, expense claims, family load.	Turn a 15-second commute voice memo into blocks and expense logs without opening four apps.
Freelancer / builder (growth)	35%	Multiple clients, irregular hours, cash-flow worries.	Make sure billable hours are scheduled and receipts logged instantly.
ADHD / visual thinker (moat)	25%	Time-blindness, list paralysis.	See 24 hours as a dial so morning, afternoon and night are instantly clear.

3. What the live app actually contains (Live Audit)

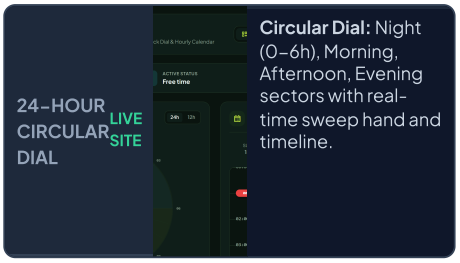

Module	What is on the page	Note
Top bar	Search (Cmd/Ctrl+K), light/dark toggle, notifications, Add New Task, currency switch, account menu (Switch Account, Export Excel, Settings, Sign Out).	Standard Shell
AI Brain Dump	Free text, Record Voice, Audio VN file, Upload Image, Ctrl+V screenshot paste; chips for Tasks / Money / Schedule; Process & Organize (Ctrl+Enter).	Core moat
Dashboard stats	Tasks completed 7/12, focus time 3h 42m, productivity score 86/100, weekly activity chart, Today's priorities, Up next, Daily insight.	KPI Row
Plan my day	One-tap AI plan from the header; 24-hour circular schedule dial with day/night sectors.	Key delight
Bottom nav	Home, Journal, Tasks, Focus, Money, Wealth, Screen (screen-time).	Extended Suite
Journal Vault	Google Drive backup; default 7-day ephemeral retention; Markdown backup download.	Privacy Anchor
Focus & Not-to-do	25:00 Deep Work timer with pause, +5m, done; target task picker; Not-to-do rules shield.	Execution
Phone SMS & UPI Hub	Webhook URL, live bank-SMS simulator (SBI, HDFC, Paytm, ICICI samples), MacroDroid guide, recent synced transactions.	India-specific
Settings and data	Excel-ready CSV export, Clean Duplicates, Security Audit (10/10), JSON export/import, Reset Local Cache.	Data Portability

4. Screen-by-screen breakdown (Real Screenshots)

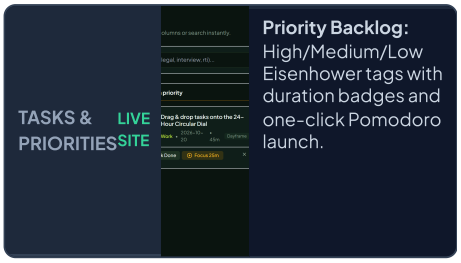

Authentic captures from the live web application showing the core interaction surfaces.

Home Dashboard: Greeting, KPI tiles, and the prominent multimodal dump dock dominate above the fold.

Circular Dial: Night (0–6h), Morning, Afternoon, Evening sectors with real-time sweep hand and timeline.

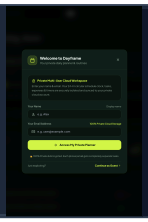

Priority Backlog: High/Medium/Low Eisenhower tags with duration badges and one-click Pomodoro launch.

Screen	Strengths	PM evaluation and risk
AI Brain Dump	One box, five input types (Voice, Audio file, Image OCR, Ctrl+V, Text), Hinglish friendly, keyboard shortcut (Ctrl+Enter).	**Risk:** if confidence is hidden, users re-check every item. Needs a lightweight review step (P1).
Plan my day + dial	Spatial view beats a linear list for time-blind users. Continuous 24h cycle anchors biological circadian rhythm.	**Gap:** Does it handle overruns and travel time? Currently static without auto-ripple rescheduling.
Money and Wealth	Currency switcher (INR/USD/EUR), daily spend, net-asset tracking, bank SMS auto-log.	Are users comfortable mixing finances into a planner? Local-first storage helps with trust.
Focus, Distraction, Not-to-do	Pomodoro tied to a task; distraction log; guardrail rules ("No phone before morning block").	Productivity score (86/100) needs transparent logic or it becomes an arbitrary vanity metric.
Export	Excel-ready CSV with UTF-8 BOM, developer JSON backup/restore.	Excellent for freelancers and portability; completely avoids vendor lock-in.

5. End-to-end user journey (Real Screenshots)

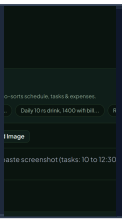

Six live screens illustrating the five key stages of a time-poor working professional's day.

0. SIGN IN / GUEST REAL UI

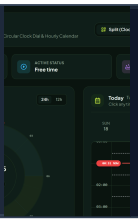

Stage 0 – Entry: Name + email or 'Continue as Guest'. Zero signup barrier.

1. CAPTURE / DUMP REAL UI

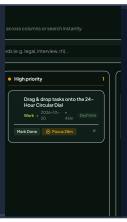

Stage 1 – Capture: User speaks: 'Subah standup 10:30, 1 baje presentation, shaam gym.'

2. SPATIAL DIAL REAL UI

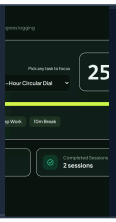

Stage 2 – Align: Items map onto 24-hr circular dial. Free time lights up visually.

3. TASKS BACKLOG REAL UI

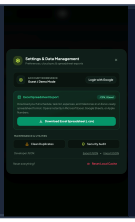

Stage 3 – Prioritize: Backlog tasks sorted with priority, duration & drag anchors.

4. FOCUS EXECUTION REAL UI

Stage 4 – Execute: 25-minute Pomodoro linked to active task with Not-to-do guardrail.

5. EXCEL EXPORT REAL UI

Stage 5 – Archive: 1-click Download Excel Spreadsheet (.csv) with UTF-8 BOM.

Stage	Cognitive state	Success metric (target, to validate)
Capture	Overwhelmed → Relieved	Time-to-capture under 5 s via voice recording.
Parse	Relieved → Trusting	Inference under 800 ms via Groq LPUs, near-zero JSON entity parse errors.
Align on dial	Clear and anchored	Zero overlapping time blocks; spatial daylight visibility.
Focus	Deep Flow	Focus sprint completion rate above 70%.
Reflect + export	Accomplished	Day-7 retention above 42%; weekly spreadsheet archive frequency > 15%.

Technical & System Architecture

Dayframe employs a **Local-First, Edge-Assisted hybrid architecture**. The UI executes entirely in the client browser for zero-latency interactions and 100% offline functionality, while compute-heavy AI tasks stream through low-latency edge functions.

LAYER 1: CLIENT PRESENTATION & OFFLINE ENGINE (PWA)

CLIENT TIER

Single-Page Progressive Web App built with Vanilla HTML5/ES6, Dynamic SVG Circadian Dial Canvas renderer (60 FPS), and Web Speech API. Stores state in browser `localStorage` with key isolation (`smart-planner-user-{id}`). Service Worker (`sw.js`) caches static assets for offline execution.

`SVG Dial Renderer (60 FPS)` `Web Speech API` `Tesseract.js OCR` `Service Worker Cache` `UTF-8 BOM CSV Generator`

▼ HTTPS / JSON Edge API (< 80ms) ▼

LAYER 2: EDGE GATEWAY & ROUTING CONTROLLER

SERVERLESS TIER

Node.js Express / Vercel Serverless Edge Functions (`server.js`). Handles auth token verification, rate limiting, request schema validation, and secure API key management preventing secret leakage to clients.

`POST /api/ai/brain-dump` `GET /api/auth/config` `POST /api/sync/supabase` `CORS / Security Headers`

▼ Sub-Second Inference Stream (< 800ms) ▼

LAYER 3A: NEURAL AI INFERENCE

GROQ LPU

Groq Cloud API running **Llama-3.3-70b-versatile**. Uses strict JSON Schema steering to extract entity arrays without hallucinating dates or currencies. Sub-second TTFT (<800ms) enables conversational responsiveness.

LAYER 3B: CLOUD MULTI-TENANT STORAGE

DATA PERSISTENCE

Supabase PostgreSQL with strict **Row-Level Security (RLS)**. Each user's tasks, journal entries, and finances are partitioned by authenticated Google UID. Fallback to Google Drive multipart diary backup.

Database Schema & Data Model

Entity	Key Attributes	Relational Constraints & Security Scope
tasks	`id (UUID)` , `title` , `category` , `priority` , `duration` , `status`	Scoped to `user_id` . Indexed on `(user_id, date, status)` .
journal	`id` , `startTime` , `endTime` , `title` , `notes`	Maps directly to 360° circular dial sectors. RLS policy: `auth.uid() = user_id` .
expenses	`id` , `date` , `item` , `category` , `amount` , `type`	Non-negative decimal values. Dynamic multi-currency formatting (INR/USD/EUR).

6. Friction analysis (The Good & The Bad)

What works (Delight & Advantages)	Friction points (Risks & Bottlenecks)
• **Zero-setup Guest mode**: No signup wall, instant value on second 1. • **Multimodal capture**: Voice, receipt image & text feel blazing fast (<800ms). • **Circular 24h dial**: Completely eliminates linear list time-blindness. • **SMS/UPI auto-log**: Genuine India-first wedge for automated expense logging. • **Excel-ready CSV export**: Clean UTF-8 BOM spreadsheet downloads.	• **Dense single-page layout**: Tasks, calendar, money, habits compete for attention. • **Fixing wrong AI slots** requires opening modal dialogues. • **Static schedule**: Schedules do not ripple when a task overruns. • **SMS sync friction**: Needs third-party MacroDroid and reachable webhook. • **Ephemeral journal**: Auto-purges after 7 days unless Drive is linked.

7. Opportunities, prioritised with RICE

Scores are illustrative PM estimates (Reach %, Impact 0.5–3, Confidence %, Effort in person-weeks); RICE = R × I × C / E.

#	Opportunity	Problem and solution	R	I	C	E	RICE
1	**Fix share & zoom basics**	og:image points at manifest.json, so link previews break; viewport blocks pinch-zoom (accessibility). Use real image, allow zoom.	100	1	90%	0.5	**180**
2	**Real authentication**	Name + email sign-in cannot back a 'private and encrypted' claim. Add Google OAuth or email OTP.	100	3	90%	3	**90**
3	**1-tap capture review drawer**	Show 'Found 2 tasks, 1 meeting, Rs 500. Approve all / Tweak' for 3 s. Target: median time to organised under 30 s.	90	2	80%	2	**72**
4	**Ripple reschedule**	When a meeting runs late, push low-priority tasks to next free slot or tomorrow. Target: missed-task recovery above 60%.	60	2	60%	4	**18**
5	**Proactive assistant**	Warn on 4 h back-to-back meetings, surface recurring bills, suggest breaks. Target: prompt engagement above 40%.	50	1	50%	5	**5**

8. Business model and metrics

Model	Benefit	Risk	Verdict
Free + ads	Zero friction, early ad revenue	Ads break focus; low India ad yield	Reject
Freemium (Free + Pro)	Viral funnel, day-1 aha moment	Free tier must be generous yet capped	Recommended
Lifetime licence ($49–99)	Upfront cash	Ongoing AI token cost gives negative margin without caps	Limited run

Dayframe Free (hook):
- Local-first 24h dial and Pomodoro timer
- 5 AI brain dumps per day
- Local storage and CSV export

Dayframe Pro, $8 / Rs 499 per month (conversion):
- Unlimited AI voice and OCR dumps
- Multi-device cloud sync with Supabase
- Two-way Google / Outlook calendar sync
- Adaptive rescheduling & WhatsApp capture

North Star metric

PRIMARY METRIC

Weekly users who organise and complete 5 or more priority commitments.

TARGET BENCHMARK

> 45% WAU

Category	KPI	Target	How to measure
Activation	Time to first scheduled block	< 60 s	Landing to first block placed on dial.
Efficiency	Net planning time	< 2 min/day	Active time in capture and organise views.
AI quality	Entity extraction accuracy	> 92%	Extracted items accepted without edits.
Retention	Week-4 retention	> 38%	Return in week 4 to log tasks or run focus.
Execution	Priority task completion	> 65%	High-priority done vs created.
Monetisation	Free-to-paid conversion	4.2–5.5%	Upgrades within 30 days of hitting the AI cap.

9. How to defend this teardown: three experiments

Experiment	Method	Signal
User problem discovery	Interview 8 working professionals about friction across WhatsApp, calendar and Splitwise; track who drops to-do apps within 7 days.	Is the fragmentation pain real and frequent?
Messy-input stress test	Run 20 chaotic inputs: Hinglish with traffic noise, blurry receipts, conflicting 2 PM meetings.	Error rate and recovery cost per input.
A/B ripple reschedule	Cohort A reschedules manually; Cohort B gets a 1-tap Auto-Rebalance prompt.	Day-14 retention delta.
